A5. Test Suite Optimization

After implementing ECP, BVA and Decision Table test cases, we reviewed the test suite to identify unnecessary duplicate test execution.

Some test cases were testing the same input conditions and expected results. For example, testing zero outstanding dues in ECP and BVA produced the same test scenario. Similarly, testing a course with 29 enrolled students out of 30 was repeated in both ECP and BVA.

We removed these duplicate executions and reused the existing test cases for multiple testing techniques. However, tests that checked different system behaviors were kept separate. For example, checking the registration decision and checking the actual registration state changes are two different tests.

The optimization reduced unnecessary repetition while maintaining requirement coverage and traceability between ECP, BVA and Decision Table testing.
